

Case Study

Urgent Technology Transfer Preserves Global Supply

The Challenge A new customer was having critical quality compliance issues with another CMO. They contracted Patheon to manufacture their sterile lyophilized drug product which was marketed globally, but had only previously been manufactured in the United States.

The Solution Due to the deteriorating situation with the other CMO, the timeline for the tech transfer was extremely short. Patheon provided a dedicated tech transfer team that worked as one with the customer to execute each aspect of the project: validation of the non-compendial analytical methods, transfer of the manufacturing process, equipment design and qualification, process validation batches manufacturing, and a stability study on the drug product.

The Outcome Due to the efficiency of Patheon's unique one-on-one approach to project management, we were able to complete the tech transfer in just 11 months – 6 months less than originally agreed – providing the customer with an uninterrupted global supply.
